PROFILE

Frontend developer with hands-on experience in React.js, JavaScript (ES6+), TypeScript, and Framer. Skilled in building dynamic, responsive user interfaces and translating designs into pixel-perfect, accessible frontends. Focused on writing clean, maintainable code that improves user experience and performance.

SKILLS

Frontend: HTML5, CSS3, JavaScript (ES6+), TypeScript, React.js, Framer

Tools: Git & GitHub, Chrome DevTools, Parcel, Vercel, Netlify, Render

EXPERIENCE

Frontend Developer — Personal & Client Projects

2025 – Present

- Migrated an existing JavaScript-based web application to React, restructuring the frontend into reusable, maintainable components.
- Designed and developed a responsive website for a luxury brand using HTML, CSS, JavaScript, and Framer, giving the client a polished, professional online presence.
- Integrated multiple third-party REST APIs to build data-driven features (live search, filtering, detail views), handling async data, loading states, and errors for a smooth UX.
- Maintained clean, version-controlled codebases using Git for structured iteration and confident deployments.

PROJECTS

Ultimate Logs Marketplace

April 2026 – Present

<https://github.com/Advantage6dev/Ultimate-Logs-Marketplace>

Stack: JavaScript, React, React Router, REST APIs

- Solved the maintainability problem of a growing legacy JavaScript codebase by migrating it to React and restructuring the frontend into reusable components, reducing future development time.
- Solved slow initial page loads by implementing route-based lazy loading with React Router, reducing the initial JavaScript bundle size and improving load performance.
- Integrated the existing API layer into the new React frontend so all dynamic marketplace features kept working seamlessly through the migration, with zero feature regression.

E-Commerce Product Page (Figma to Code)

April 2026

<https://e-commerce-rho-ashen-63.vercel.app/>

Stack: HTML5, CSS3, JavaScript (ES6+)

- Solved the problem of turning a static Figma design into a working product page by translating it into pixel-perfect, semantic HTML and CSS, matching spacing, typography, and layout precisely.
- Built an interactive image gallery with a lightbox and a quantity/cart preview using vanilla JavaScript, replicating the design's exact interaction states without a framework.
- Solved cross-device layout issues by implementing a fully responsive design with a mobile navigation menu, ensuring the page matched the Figma spec across breakpoints.

Mapty Web Application (Personal Project)

February 2026

<https://mapty-nu-steel.vercel.app/>

Stack: Vanilla JavaScript (OOP/ES6 Classes), Leaflet.js, Geolocation API, Local Storage

- Solved the problem of manually tracking outdoor workouts by building a geolocation-based tracker that lets users log running and cycling activity directly on an interactive map.
- Modeled workout data with object-oriented JavaScript (ES6 classes) to automatically calculate pace, speed, and elevation gain in real time, removing manual calculation for the user.
- Used the Geolocation API to auto-center the map on the user's current location, reducing setup friction when starting a new log.
- Persisted workout data with Local Storage, solving data loss on page refresh and keeping logged workouts available across sessions.

Grandeur Brand

November – December 2025

<https://grandeurs.vercel.app/>

Stack: Framer, HTML, CSS, JavaScript

- Solved a luxury brand's need for a credible, professional web presence by designing and building a fully responsive marketing site from scratch using Framer.
- Built a product-focused interface with clear product information and page flow, improving on-site engagement and shopping experience.

EDUCATION

Bachelor of Science (B.Sc.) in Computer Science

March 2024 – Present

Ladoke Akintola University of Technology (LAUTECH)
